

JONAH ODOH

Senior Platform & AI Engineer — Backend | Distributed Systems | AI Infrastructure

jonahodoh@gmail.com | +2348163721459 | [LinkedIn](#) | [Portfolio](#)

SUMMARY

Senior Platform & AI Engineer with 7+ years of experience designing and delivering high-availability distributed systems across fintech, healthcare, and AI platform engineering. Currently building distributed Kubernetes infrastructure for large-scale LLM benchmarking and AI evaluation pipelines at Bespoke Labs. Deep expertise in Java, Python, Node.js, and TypeScript, with a strong track record of building scalable backend microservices, integrating ML models and RAG systems into production, and driving end-to-end delivery across the full software development lifecycle. Experienced in cloud-native engineering on AWS and GCP. Adept at contributing to system design and architecture decisions, and bridging backend engineering with AI productionization.

WORK EXPERIENCE

Senior Platform Engineer

Bespoke Labs — California, United States *02/2026 – Present*

- Design and build distributed Kubernetes-based infrastructure for large-scale LLM benchmarking, workflow orchestration, and AI platform reliability testing across high-throughput engineering environments.
- Architect and improve backend automation, CI/CD pipelines, and observability tooling (Prometheus, Grafana), reducing environment drift, improving deployment consistency, and strengthening system stability across evaluation pipelines.
- Collaborate with AI researchers and platform engineers to design scalable solutions for workload isolation, distributed execution, and rollout analysis — driving reliability and operational efficiency at scale.
- Act as a technical point of contact for infrastructure debugging and incident resolution, applying on-call practices and systematic root cause analysis to maintain platform health and minimise downtime.

Senior Software Engineer

Andela — New York, United States *02/2025 – 02/2026*

- Owned end-to-end product delivery for global client engagements, translating business goals into technical solutions for platforms serving 10,000+ active users — from discovery and scoping through implementation, launch, and production support.
- Drove product and engineering decisions on backend architecture, system design, and API strategy — reducing average request latency by 25% and increasing throughput across critical user workflows.
- Partnered with product managers, designers, and stakeholders to shape roadmaps, prioritize backlogs, and ship features that accelerated delivery cycles by 15-20% while cutting production incidents by ~30%.
- Led system design discussions, cross-team code reviews, and technical documentation, improving code maintainability and deployment reliability across cloud environments.
- Championed engineering best practices and idempotent system design, ensuring data consistency and resilience under high load across distributed services.

Software Engineer

Stax — Karabo Fintech Platform — Lagos, Nigeria *02/2022 – 01/2025*

- Designed and implemented scalable backend microservices powering secure, reliable processing of 100,000+ monthly financial transactions with sub-200ms response time — including a double-entry wallet and ledger system on Spring Boot and PostgreSQL with ACID-compliant transaction handling and optimistic locking to prevent concurrent balance inconsistencies.
- Engineered a dynamic payment routing engine that selects optimal providers based on transaction type, amount thresholds, real-time provider health, and cost efficiency — cutting payment processing latency by 30%.
- Drove system reliability with circuit breakers, fallback mechanisms (Resilience4j), and automated reconciliation jobs — achieving 99.9% payment success rate and 99.9% uptime while improving financial auditability and reducing manual oversight.
- Built React-based internal dashboards for real-time transaction monitoring and wallet management, giving operations teams live visibility into payment flows and system health.

- Built a Retrieval-Augmented Generation (RAG) system using LangChain, OpenAI, and Pinecone to power customer and agent support query resolution — indexing internal policies, transaction context, and operational knowledge bases to deliver accurate, context-aware responses and reduce agent escalation time.
- Shipped AI/ML capabilities into production by integrating Scikit-Learn and XGBoost models for real-time credit risk decisioning — turning data into product features that supported business outcomes.

Software Engineer

Reliance Health — Lagos, Nigeria 01/2019 – 01/2022

- Designed and maintained scalable APIs and microservices powering core healthcare features — telemedicine consultations, EHR, patient management, and prescription services — across a platform serving 50k+ active patients.
- Implemented server-side business logic across critical healthcare workflows, reducing consultation scheduling errors by 25% through precise validation, error handling, and iterative optimisation.
- Built secure integrations with payment gateways, insurance claims systems, and third-party healthcare providers, streamlining claims processing and cutting reimbursement delays by 30%.
- Engineered HIPAA-compliant data flows across relational and NoSQL databases with secure authentication, ensuring reliable and legally compliant handling of sensitive patient information.
- Developed monitoring and analytics pipelines to track patient engagement and service usage, enabling data-driven platform improvements that boosted reliability to 99.9% uptime.
- Collaborated with doctors, product managers, and QA engineers across the full development lifecycle to deliver health-tech features supporting Reliance Health's growth across Africa.

TECHNICAL SKILLS

Languages: Java, Python, JavaScript, TypeScript, SQL

Frameworks & Libraries: Spring Boot, Node.js, NestJS, React, Next.js, Flask, Django, Resilience4j

AI/ML: RAG Systems, LangChain, OpenAI, Pinecone, LLM Orchestration, Scikit-Learn, XGBoost, Model Serving, MLOps

Backend & Architecture: Distributed Systems, Microservices, REST API Design, Event-Driven Architecture, Clean Architecture, ACID Transactions, System Design

Cloud & DevOps: AWS, GCP, Docker, Kubernetes, Terraform, Ansible, CI/CD Pipelines, Prometheus, Grafana, Observability

Databases: PostgreSQL, MySQL, MongoDB, Redis

Security & Compliance: HIPAA, Fintech Regulatory Standards, OAuth 2.0, JWT, Encryption, API Security

Testing & Quality: TDD, Unit Testing, Integration Testing, System Testing, Code Review, Incident Response

EDUCATION

B.Sc. Economics — University of Lagos (2016 – 2021)

Diploma, Software Engineering — Semicolon Africa (2019 – 2020)

Business Education & Entrepreneurial Development — Henley Business School (2020)
